

ABSTRACT

METHOD AND APPARATUS LOAD BALANCING SERVER DAEMONS WITHIN A SERVER

A method and apparatus in a data processing system
5 for binding a plurality of server daemons to a
destination address and port. A request for a connection
from a client is routed using a destination address. A
server daemon within the plurality of server daemons is
selected to form a selected server daemon. The request
10 is routed to the selected server daemon by changing the
destination address to a server address for the selected
server daemon. When a response is returned, source
address in the response is changed to the original
destination address.
